

ABSTRACT

An output accumulation sequence of a destination of the print job is discovered and if the output accumulation sequence of the destination is back of second sheet to front of first sheet, the sheets of the print job are sequenced in reverse order. The output accumulation sequence of the destination is discovered either by choosing the output accumulation sequence or ascertaining the destination and discovering, from the destination, the output accumulation sequence of the destination. The output accumulation sequence of the destination is discovered from the destination by either querying the destination or searching an index for a record of the destination and discovering the output accumulation sequence from the record of the destination.
